

LAB 1 PROJECT REPORT

The roles:

Daniel Tchonang: ER diagram design, PowerPoint.

Amine Sira: ER diagram design, Report

Mohammed Oumane: ER diagram design, Report

Zaid Zehari: ER diagram design, PowerPoint

The key challenges:

Remote work: Our teammate Zaid was not on campus so he had to work remotely from home.

BD1: we took a long time to decide if “budget disbursed” is an attribute or

Relationships: we had a confusion on how to represent the constraints between binary and ternary relationships

Justifying the modelling choices:

RE3: We could not model the approver as an entity since it is a person. According to our design it is either a student or an employee. If we assume it is an employee, it is either an academic or a non-academic which isn't precised by the lab. Instead we have added a relationship “approve”.

EQ6: we have added a new attribute “is portable” to precise if the equipment units are portable or fixed.

CO8: we have decided to use the aggregation because we needed a relationship between consumables, laboratories and the technical employee.

Assumptions:

No assumptions were made regarding the ER model.

Non expressed requirements on the ER diagram:

PE5: we could not express that the dean does not report to anyone.

PR2 : we could not express that the administrative staff cannot make reservations.

PR3: We could not express that 1 unique PI is a necessity, nor count how many co-PI's and collaborators exist for each project.

EQ7: we could not modelise an eligible person.

RE4: we could not modelise that each equipment unit should be reserved.

RE3 : we could not set the condition that a reservation must be approved to exist

MA3: we intended to make the relationship between the EU, technical staff and maintenance to be ternary, but we couldn't do so because of the difficulty of the design and insufficient time.

RE1: we mistakenly put a relation between equipment model and reservation when we should've made it with the equipment until, we couldn't correct it due to time shortage. We apologize.

We have concluded that conditional choices cannot be represented in an ER diagram
